Price List & Order Form	-----	22

MBRM are developers of the world-famous **MBRM UNIVERSAL Add-ins®**. With 30,000+ users world-wide, the UNIVERSAL Add-ins are the most widely-used derivative software for the pricing, risk management, trading, arbitrage, fund management and auditing of securities, options, futures and swaps in the convertible, fixed income, commodities, energy, equities, foreign exchange and money markets. **Links with most real-time feeds create a powerful and dynamic analytical environment.** MBRM's software is used world-wide in mission critical applications by most major Investment Houses, Money Managers and Corporate Treasuries.

The UNIVERSAL Add-ins are all implemented as function calls in a Dynamic Link Library (DLL), thus assisting in the ease of use and integration into the user's analytical environment. They can therefore be called from Excel, Access, Visual Basic, C, C++, Fortran etc. This object-orientated building-block approach provides unequalled speed, cost-effectiveness and flexibility. MBRM's technical support is excellent since the software has been designed and implemented in-house. A free fully functional 30 day trial can be downloaded from MBRM's internet web site:

<http://www.mbrm.com>

MBRM also provides source code and analytical consultancy to integrate its technology into existing in-house systems. This provides an alternative to either developing the software in-house, or buying in a potentially inflexible third party system. By sharing its analytical techniques with many clients, MBRM can assist you in building a low cost in-house solution with world-beating analytical tools. Additionally, MBRM provides customised risk management training which uniquely combines analytical excellence with technology solutions, at either their or the client's premises. This would be tailored to the participants' backgrounds, whether they are traders, technology or internal audit professionals. This could include solving real life problems with which the participants are struggling.

MBRM are pioneers of the financial add-in and toolkit market segments and have been continuously providing leading edge analytical solutions since 1988 and have one of the longest successful track records in the industry. MBRM regard this as essential since every sale is the start of a long term partnership.

MBRM was founded in 1988 by Dr. Mamdouh Barakat.

Dr. Mamdouh Barakat was educated at Brighton College and was honoured with the accolade, Old Brightonian of the Month (March 2014). He went on to the London School of Economics (LSE) where he received his BSc (1st class honours) in Management Sciences, MSc (distinction) in Operational Research and PhD in the field of Artificial Intelligence in Simulation Modelling.

Professionally, Dr. Barakat joined international investment bank Drexel Burnham Lambert as a quantitative analyst. He subsequently held the post of Senior Managing Director of the Philadelphia based FNX Limited, who provide global risk management systems to the largest institutions in the world.

In 2003, Dr. Barakat joined the Education and Standards Committee of the Professional Risk Managers' International Association (PRMIA). The Committee is charged with the development of PRMIA's Standards of Practice, Conduct and Ethics (Code of Conduct) and the Professional Risk Manager (PRM) program which is both a certification and professional development program.

As founder and Managing Director of MB Group, Dr. Barakat coordinates investments and ventures in various sectors.

MBRM UNIVERSAL Add-ins®

The UNIVERSAL Add-ins® are compatible with Excel (including the multi-threaded calculation / MTC feature), Access, VB.NET/Visual Basic/VBA, C/C++/C#, Java, Python, Fortran, etc. running on all major versions of Windows.

UNIX (Solaris, Linux, AIX) static and shared libraries available.

C/C++ source code license also available.

UNIVOPT - Universal Options Add-in

UNIVOPT is regarded by many dealers and risk managers as the industry standard option pricing and risk management system. Amongst the new features are 6 new models. The options add-in calculates option prices and implied volatilities using the Black, Black-Scholes, Garman-Kolhagen, Cox-Rubinstein (binomial) models, as well as proprietary models for normally distributed underlying instruments. UNIVOPT handles European and American style options on bonds, commodities, currencies, futures (including 3M interest rate futures) and shares (including constant dividend streams and discrete dividend payments). It also calculates sensitivities, such as delta, gamma, fugit, kappa (vega), rho, theta and theta2.

UNIVOPT also contains a warrant pricing function which takes into account dilution (which is very useful when analysing warrants about to be issued by companies on their own stock).

UNIVOPT enables the production of pricing matrices, risk return profiles and implied volatility analysis for either individual options or portfolios.

A number of example spreadsheets are supplied free with UNIVOPT, which enable the user to price and risk manage option portfolios “straight out of the box” without any programming or “spreadsheet” work.

UNIVEXOT - Universal Exotics Add-in [requires UNIVOPT]

The exotics add-in calculates prices, sensitivities and implied volatilities of Exotic options, including Average price (Asian), Barrier and double Barrier (Knock-out and Knock-ins), Quanto Basket Asian options, Digital, Compound, Contingent, Ladder, Lookback and one and two Touch options on bonds, commodities, currencies, futures and shares (including constant dividend streams and discrete dividend payments). Windows Barriers are also supported (windows can be up front, in middle or at end). For maximum flexibility and sensitivity testing, it allows the user to choose either a numerical (e.g. binomial tree) algorithm or a flexible Monte Carlo simulation algorithm. Smoother

handling of barriers are implemented to improve accuracy of numerical models.

With a single function call, UNIVEXOT calculates the full sensitivities of Spread and Power options. UNIVEXOT also analyses two asset Rainbow options where any user specified pay off formula can be entered.

When UNIVEXOT is combined with UNIVOPT, you have a formidable combination for most standard and exotic options in an easy to use package.

UNIVINT - Universal Interpolating Add-in

The interpolating add-in contains a number of interpolating lookup functions (straight line, cubic splining, exponentials and polynomial least squares fit etc.) which have a wide variety of uses, including performing lookups on one or two dimensional volatility smiles and surfaces, forward commodity rates, forward FX points etc. The two-

dimensional lookup capability is especially useful for looking up swaption volatilities.

The interpolating add-in can be used by itself or with any (or all) of our other add-ins, thus providing the ability to create complex term structure models.

UNIVYLD - Universal Yield Add-in

The yield add-in is the finest global yield add-in available. Its lightning speed, range of instruments handled and extensive analytics gives the user a competitive edge. It handles international fixed income products including MTNs, deferred, long or short first coupon bonds as well as bonds callable between coupon payment dates. In addition to the standard market convention yields, the calculator calculates exact TRUE yields (taking into account weekends and holidays), money market yields on all instruments (which can be compared directly with Libor), forward prices (e.g. for repos or bond options), hedge ratios and sensitivities (e.g. duration and convexity) consistent for instruments which have a different number of payments per annum (since using 'standard' unadjusted duration numbers could lead to unnecessary risk exposure due to inaccurate hedging), conversion factors to convert from yield volatility to price volatility (or vice-versa) and US Treasury Equivalent Yields on all instruments.

The yield add-in enables the setting up of international fixed income portfolios, with consistent yield, duration and convexity analysis, using your familiar spreadsheet, database or programming language. It also has a cash flow ~~analyser~~ **analyser for swaps, projects, loans and esoteric instruments**. For quantitative analysts, it provides the ability to construct risk/return profiles on arbitrage trades as well as models of bond futures. For dealers, it enables the setting up of a very flexible trading system. Its uses are thus endless in the fixed income environment.

UNIVYLD handles virtually every bond market in the world (e.g. for Australian bonds, Canadian bonds, Eurodollar FRNs, Eurosterling FRNs, French government bonds, JGBs, South African Bonds, Spanish Bonds, Swedish money market instruments, UK gilts, US bills, US treasuries, US corporates, yankees etc).

Optional module for **UNIVYLD** users -

MBRM Bond Futures “Cheapest To Deliver” (CTD) Analyser

This module calculates conversion factors and then analyses the deliverable bonds, including calculating the gross and net basis for every deliverable, break-even REPO rates, implied price

duration of the future and deliverables, hedge ratios, fair values and identifying the “cheapest to deliver” (CTD) bond. Sample spreadsheet provided: MBRMCTD.XLS

UNIVSWAP - Universal Swap Add-in

The swap add-in is an interest rate and cross-currency swap add-in. The add-in builds a No-Arbitrage term structure model for interest rates and volatilities (using mean reversion) from any combination of bonds, swaps, bills, deposits and/or futures. This term structure is used to consistently price instruments, including Bonds, Swaps, FRAs, IRGs, Caps, Collars, Floors, Corridors and Digitals. The approach used for volatility modelling is based on the extended Vasicek (Hull-White) models, with a number of proprietary improvements. This gives maximum flexibility to quantify both standard and non-standard transactions. The swap add-in enables the user to

check the prices being quoted by the counterparty, increasing the user's competitive advantage. Multi-currency portfolios are continuously marked to market - improving P&L and Risk monitoring.

UNIVSWAP - Universal Swap Add-in incorporates, at no extra charge, full copies of the following four Universal Add-ins :

- UNIVOPT** - Universal Options Add-in
- UNIVEXOT** - Universal Exotics Add-in
- UNIVYLD** - Universal Yield Add-in
- UNIVINT** - Universal Interpolating Add-in

UNIVCMS - Universal CMS & Swaptions Add-in [requires UNIVSWAP]

This is an optional add-in for users of our **Universal Swap Add-in** who require the pricing and risk management of Constant Maturity Swaps (CMS) and/or European, Bermudan and American style options on Bonds or Swaptions. The CMS Add-in analyses multi-callable amortizing swaps and bonds, including passing in a Constant Elasticity of Variance (CEV) and full Swaption Volatility grid directly to BDT/BK pricing model. Also handles CMS Quanto Caps, Collars, Floors and Corridors. The approach used is based on the Black-Derman-Toy (BDT) and/or extended Vasicek (Hull-White)

interest rate models for implementation of a No-Arbitrage term structure model for interest rates (with mean reversion), and utilises a balanced trinomial tree for increased accuracy. Market standard calculation of swaption prices AND SENSITIVITIES assuming constant "black" volatility are also implemented using a single function call. UNIVCMS also implements a very fast calibration of extended Vasicek (Hull-White) volatility and Mean Reversion term structures without using Excel's Solver.

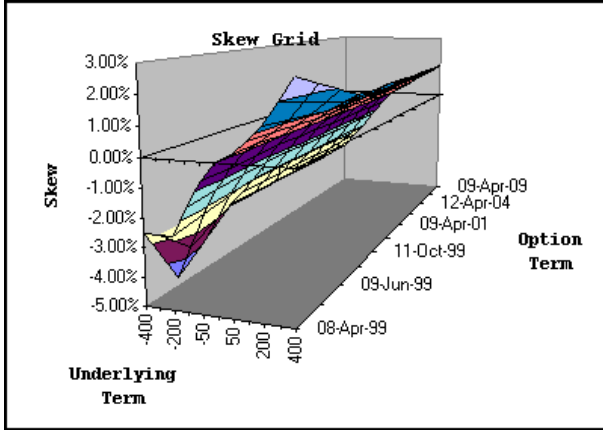

UNIVLMM - Universal LIBOR Market Model Add-in [requires UNIVSWAP]

UNIVLMM implements the cutting edge multi-factor LIBOR Market Model and "Brace-Gatarek-Musiela" (BGM) model to price and risk manage interest rate derivatives, including multicallable amortizing and accreting Swaptions; Delivery Options in "Cheapest To Deliver" (CTD) Bond Futures; Exotic Interest Rate derivatives such as AutoFlex Caps; Knock-out caps; Reset Caps; Trigger knock-out/knock-in Swaps/inverse floaters; Spread Options; Captions; Options on swaptions; Callable Power Reverse Dual Currency (PRDC) swaps and notes; Callable range accrual dual currency quanto notes; Bermudan Callable CMS

spread bonds; Callable Capped FRNs; Target Redemption Notes (TARNs) and FX Target Redemption Notes (FX-TARNs), including Reverse Floating TARNs; Crescentos / Snowballs / Ladders / Lift notes; ladder inverse floaters; Ratchets and Bermudan callable fixed to floater (flip flop), including step-up fixed rates. UNIVLMM allows you to calibrate the LIBOR Market Model's multi-factor interest rate volatility term structure based on individual CAPLET volatilities and/or market quotes for traded instruments (e.g. swaptions, caps and floors), including fitting expected correlations between different parts of the curve.

Calibration and pricing are very fast.

UNIVCONV - Universal Convertibles Add-in

The Universal Convertibles Add-in handles portfolios of Convertible Bonds with structured calls, puts and conversion schedules, non-stationary share/bond correlation, time dependent credit spreads, discrete and continuous dividends, cross-currency and multiple conversion ratio resets. The add-in can be linked with most real-time feeds to provide a dynamic analytical environment which continuously marks to market multi-currency portfolios and thereby improves P&L and Risk monitoring.

General Features:

- 5 different models for assumed equity growth and discounting.
- DECS (Dividend Enhanced Common Stock / Debt Exchangeable for Common Stock) are handled **using a TREE instead of the usually slower and less accurate Monte Carlo Simulation.**
- Simple Resetables and complex Multiple “CHAIN” resetables are handled **using a TREE instead of the usually slower and less accurate Monte Carlo Simulation.** Chain resetables are where there are multiple resets where the maximum or minimum reset price is a function of the previous reset, which is currently unknown.
- Bonds can be defined in terms of explicit cash flows, thereby enabling the analysis of irregular coupon bonds (including step ups, step downs and rollercoasters).
- The ability to calculate the implied credit spread and the implied yield volatility from a convertible bond price.
- Enhanced Dividend escrow handling.

The system has 3 very fast models implemented:

- 1-factor Equity trinomial lattice tree - with variable volatility term structure.
- 1-factor Interest rate trinomial No-Arbitrage lattice tree - with variable volatility and mean reversion term structure. This very efficiently and easily analyses **callable and/or putable bonds, bond options and Bermudan swaptions (constant, amortizing or roller-coaster nominals) using the Black-Derman-Toy (BDT) and/or extended Vasicek (Hull-White) interest rate models.**
- 2-factor (9 node) model. Combines the Equity and Interest rates into a 2-factor tree.

Dr Mamdouh Barakat, Managing Director, says “We believe that our convertibles add-in sets a new standard for accuracy, speed AND price which other systems will find hard to beat. The accurate analysis of Convertible Bonds is a very complex area. This is one of the reasons why there are very few software packages available for analysing Convertible Bonds. In our convertibles add-in, we have combined the latest techniques and models from both the fixed income and equity derivative world. We are also constantly enhancing it for the new structures (e.g. make whole payments, reverse convertibles, conversion trigger levels etc).”

For increased accuracy and functionality, we strongly recommend that Universal Convertible Add-in be used with our Universal Swap Add-in. Then, instead of passing a single constant interest rate, UNIVCONV can take into account the whole yield curve (utilising UNIVSWAP to calculate the interest rate zero curve term structure from the quoted market rates for deposits, futures, swaps and/or bonds).

UNIVDRV - Universal Derivatives Add-in

Universal Derivatives Add-in is an inclusive package of:

UNIVEXOT+ - Universal Analytical Exotics Add-in
UNIVFDIF - Universal Finite Difference Add-in
UNIVGARCH - Universal Garch Add-in

UNIVEXOT+ - Universal Analytical Exotics Add-in

This module implements the latest research papers on the analytical pricing of exotic options (including continuous and discrete barriers and continuous and discrete lookbacks). When UNIVEXOT+ is

combined with UNIVEXOT, this enables numerical, Monte Carlo and analytical option pricing and risk management.

UNIVFDIF - Universal Finite Difference Add-in

UNIVFDIF implies the local volatility surface and then prices and calculates the full sensitivities of European, American style and Bermudan variable strike Exotic options (including discrete windowed and double barriers) on bonds, commodities, currencies, futures and shares (including discrete

dividend payments). The add-in uses the finite difference algorithm which is more advanced than standard binomial trees. Full term structure of interest rates and Multi-Dimensional Local Volatility Surface are handled.

UNIVGARCH - Universal Garch Add-in

UNIVGARCH implements various Garch models (including N-GARCH, E-GARCH, O-GARCH, O-Garch(1,1)-AR(1) and N-Garch(1,1)-AR(1)). Proprietary optimisation techniques are utilised to enable the practical use of Garch models in a trading environment. The Garch model increases the accuracy in the pricing of standard and exotic options (including Windowed Barriers and Windowed one and two touch options) where the underlying does not follow a perfect lognormal distribution (e.g. it has fat tails or non-standard Kurtosis). **The Garch model has been proven more accurate than “Black-Scholes” type models, especially for out of the money options which are close to maturity.**

The Garch model is considered an effective volatility forecaster. UNIVGARCH thus enables the forecast of the forward volatility for any time

period and this volatility forecast can also be used in a standard option pricing model, increasing the accuracy of the standard option pricing model.

Simulations can be carried out with variable step length, including the handling of discrete dividends and a term structure of interest rates. These substantially increase the accuracy and types of options which can be analysed. Advanced variance reduction techniques are also implemented to substantially increase the accuracy/speed ratio.

UNIVGARCH can also be used for the Monte-Carlo pricing of standard and exotic options assuming a constant volatility, therefore increasing the scope of usage to situations where a standard log-normal distribution is desirable.

MB Risk Management

an FSS® - Financial Systems Software® company

UNIVVAR - Universal VaR Add-in “Value-at-Risk”

UNIVVAR calculates a portfolio’s exposure to market risk and expresses the exposure in terms of Value-at-Risk (VaR). It also calculates “Incremental VaR” (the incremental effect of a single trade on the whole portfolio’s VaR). Cash flows are automatically mapped to multiple vertices. Automatic calculation and comparison of Analytical, Monte Carlo, stress and historical VaR enhances risk management. Whilst the add-in calculates the historical variances and correlations between assets, UNIVVAR also supports historical Garch simulation without variance/correlation matrices, which considerably improves robustness and accuracy.

Combining UNIVVAR and UNIVDRV - Universal Derivatives Add-in

When UNIVVAR is combined with the UNIVDRV - Universal Derivatives Add-in, you can calculate Delta-Gamma VaR, as well as historical variances and correlations between assets. You can also generate simulations using historical Garch simulations and/or historical returns (without variance/correlation matrices) and display the resultant VaR numbers and return distributions.

General Features:

- Calculates Value-at-Risk (VaR) for multi asset portfolios.
- Analyses Incremental VaR : the incremental effect of a single trade on total VaR.
- The ability to enter stress testing scenarios and historical (back testing) scenarios.
- Automatic calculation and comparison of :
 - Analytical VaR
 - Monte Carlo Var
 - Stress Testing Scenarios
 - Historical Garch simulation without variance/correlation matrices, which considerably improves robustness and accuracy.
- Assets handled include Commodities, Energy, Equities, Fixed income, Foreign Exchange and Money Markets.
- Useful for the analysis of complex multi asset dependent options and securities portfolios.
- Useful for compliance and regulatory risk management purposes.
- Compatible with JP Morgan’s RiskMetrics datasets.

MBRM Futures/FRAs Arbitrage Module

This is an optional module for Excel users of our **Universal Swap Add-in** who require the analysis of the arbitrage opportunities between interest rate futures, FRAs and Swaps. The module is designed to be used by traders in a fast moving market. Therefore ease of use is maximised. Grids are

calculated and displayed for forward futures, FRAs and Swaps to enable the quick comparison of the arbitrage opportunity between the markets. Trades are entered and the positions are continuously marked to market.

UNIVCRD - Universal Credit Risk Add-in

UNIVCRD calculates a portfolio’s exposure to counterparty risk. A major feature is the use of an analytical methodology which provides a considerable speed advantage over traditional

Monte Carlo approaches and which supports default correlations. Instantaneous calculation of credit risk enables real-time monitoring by traders and risk managers.

UNIVCDRV - Universal Credit Derivatives Add-in

The Universal Credit Derivatives Add-in prices Credit Default Swaps and Credit Default Options. A protection buyer pays a regular (or one-off) fee and in return, if there is a credit default, he receives a one-off compensation payment. The system can imply the default probabilities (or recovery rates) from traded credit default swaps and/or credit options. In addition, the add-in can revalue credit default swaps and/or credit options after they have been traded in order to calculate a theoretical P&L.

This approach has many advantages over implying the default probabilities from bonds, including the fact that there may not be liquid publicly traded bonds issued by an issuer for all maturities (if at all), whereas the OTC credit derivatives market can trade credit default swaps and/or credit options for any issuer at any maturity. The credit derivatives market, being more specialised and focused than the underlying bond market, is also likely to be a more accurate estimator of default probabilities than the bond market.

For increased accuracy and functionality, Universal Credit Derivatives Add-in requires UNIVSWAP - Universal Swap Add-in. This is because the Universal Credit Derivatives Add-in internally calls UNIVSWAP for interpolation of yield curves and date calculations.

These advanced functions allow for more complex credit derivative analysis, including :

- Fees can be paid in advance or in arrears
- Different credit spreads for the Fee Receiver (Insurer) and the Fee Payer (Insured)
- Amortization Schedule handles rollercoasters (i.e. amortizations & accretion)
- Increased flexibility in the definition of fee payment dates / payment cycles
- Holidays taken into account for fee payment dates and amounts
- Additional accrued types handled
- Additional interest rate interpolation techniques for accuracy
- Automatically links to UNIVSWAP currency sheets

UNIVSWAP - Universal Swap Add-in

incorporates, at no extra charge, full copies of the following four Universal Add-ins :

- UNIVOPT** - Universal Options Add-in
- UNIVEXOT** - Universal Exotics Add-in
- UNIVYLD** - Universal Yield Add-in
- UNIVINT** - Universal Interpolating Add-in

MBRM Exchange Traded Options System

General Features:

- Handling of ETO contracts on most exchanges, including equity derivatives and interest rate futures.
- Evaluation of FTSE options on the LIFFE exchange, including the modelling of early exercise (wild card option).
- Full risk analysis (including scenario analysis). Risk broken down into individual contracts and strikes.
- Graphical modification of volatility skews.
- Pricing sheets can be easily adjusted for different formats.
- Multiple formats for one contract possible.
- Up to eight contracts on one pricing sheet.
- Open system approach enables linking to most real-time feeds.
- Positions from multiple dealers/contracts can be monitored and consolidated centrally.

(NOTE: The **MBRM** ETO System requires **UNIVOPT** and **UNIVINT** to operate)

These pages list some of our clients from around the world.

WHAT DO THEY KNOW THAT YOU DON'T?

Some of the comments that we have received from our clients.

US Consultant

The flexibility, along with the quality of the models, is what makes your software so appealing. Thanks again for your admirably prompt attention to my questions.

Major Far Eastern Central Bank

I'm Head of Capital Markets Division at the Central Bank. After all the recommendations that we had from the companies that we work with, it seems your software is one of the best in the market.

US Hedge Fund

We did not have any problems with MBRM. Your product has worked flawlessly for me every single day. And the support that you personally provided when I needed it is absolutely the finest that I have encountered in my 25 years in the software industry. Your product and service are so superior.

American Retail Bank

During MBRM's 2 day training course, we had a live amortizing swap deal to price. Using MBRM's calculated values, we were able to negotiate a \$50,000 savings on that one deal alone.

Swiss Savings Bank

Congratulations, your software is now used for the whole risk management department.

European Broker

What's excellent about your system is that you can call one function to handle a very wide range of instruments.

Quantitative Analyst at a UK Investment House

It was nice to talk to you, and I must say I appreciate even more the way your add-ins are structured (specifically the .lib stuff which will prove very useful). This is going to make any development work I might have so much easier.

Japanese Investment Bank

All merits of BGM which you pointed out were true. We were impressed with that calibration speed. We respect your academic experience and professionalism in finance.

US Hedge Fund

Your product is working really well. I am very satisfied, especially with your superb support.

US Energy Derivatives Broker

I have found your UNIVOPT and UNIVEXOT software essential to analyse energy options, including on energy swaps. I will recommend you to all my clients since they do not have very sophisticated systems for derivatives.

US Software House

We understand MBRM is the leader in risk management and pricing models.

Major European Central Bank

The decision to use your Excel add-ins at the Central Bank has been made. If Dr. Barakat is ever visiting our city, we would be very pleased to welcome him at the Central Bank.

American Investment Bank

I read in a book that “there is no commercially available” Finite Difference model that handles skews and term structure of implied volatility and interest rates. I would say that “there is one” by MBRM. Thank you very much for your time and great help.

US Corporate Treasurer

You guys are great. I love your system.

Treasury Systems Consultant

It was good to meet you. You have done such a good job of getting your product in front of everyone (hence the long client list), that I hadn't realised that I actually hadn't met you before. In fact everyone I speak to seems to know of you and your product which is quite a feat given this industry.

Interest Rate Trader at a Major Japanese Investment Bank

In my opinion it does what we want to do and I feel confident that if there are one or two products that is not obvious to me how to price, you will happily advise us or add them to the package in future versions if necessary. Indeed I was really impressed with the prompt response to my queries during the trial period.

Australian Financial Specialist

Thanks for the fantastic speed of response - do you ever sleep?

Major US Investment Bank

We have tried a number of option pricing software and found your UNIVOPT the fastest.

Major European Investment Bank

Your binomial option pricing model is electric. It was instantaneous. We wrote our own but it was too slow when analysing a portfolio.

US Corporate Treasurer

I am quite impressed with the quality of your product. Your level of sophistication is certainly beyond that of most other add-in type products currently available. I must also thank you for your excellent support and the time you have spent in explaining to me the advanced features and capabilities in your software.

US Hedge Fund

You have worked very closely with us. If we need something done, we are likely to get it immediately. I don't think you guys sleep.

Financial Engineer

We were successful in calling your routines from our database system. We currently have our own routines to price the hedges, however, we were looking to your routines for calculation speed and reputation as an industry standard.

Head of Arbitrage & Future Trading at Major Japanese Investment Bank

I am incredibly pleased by the speed at which you created a customised system for our requirements. I will recommend it to all my friends.

Major European Investment Bank

One of the major differences between MBRM and other software houses we have dealt with is the personal service we receive. When we have a question, we get straight through to someone who can help us. This is invaluable.

MB Risk Management

an FSS® - Financial Systems Software® company

Major US Investment Bank

You have a really great system.

Risk Management Consultant

The Universal software is a bloody good system with great functionality. The easiest to use of all the add-ins I have seen. I have used it for so many years that it is second nature to me. I must be your best salesman, I have always recommended you.

Managing Director of Member Firm of LIFFE

Your system is phenomenal. Your flexible approach to quick customisation is just what we are looking for.

European Investment Bank

You have a great product.

Equity Derivatives Trader at a Major London Investment Bank

I feel guilty about using your software successfully for many years since it cost so little. We use it to link with Reuters real time feeds.

Quantitative Analyst at a Major Energy Corporation

If you keep going like this, you will be putting pricey quants in the City out of work!! I was only kidding! The quants will use your software to build more advanced models. This kind of enhancement of everyone's knowledge and understanding of derivatives will only serve to reinforce the importance of quantitative analysis, rather than to undermine it, and I'm all for it. When are you re-locating to Seattle?

Senior Treasurer of a Major Corporation

We have been one of your earliest customers and you have always looked after us. We have begun using your new Universal Convertible Add-in and it deserves to be the industry standard.

German Fund Manager

I think your add-ins are very useful. We use them to price Bermudan options on zero-coupon bonds.

Major UK Derivatives Broker

It is widely recognised that your software is very good and sold at rock bottom prices.

Head of Risk Control at a Major International Bank in Switzerland

We have utilised your Universal add-ins to calculate the capital adequacy sensitivities (e.g. deltas, gammas and scenario sensitivities) required by the central bank. Not only are they inexpensive, they are complete and tremendously flexible. They can handle all the instruments and the central bank has approved our system.

US Investment Bank

Your products are very complete and exactly the kind I was looking for.

Major International Investment Bank

We found your policy of allowing the use of both the 16 bit and 32 bit versions of your add-ins on the same machine as very useful since we have some dealers using both 16 and 32 bit applications under Windows NT. Some other software houses ask us to buy two different versions of their software, which effectively double their prices when compared to yours.

Major US Pension Fund Manager

We use your term structure interest rate models to assist us in our asset/liability management since they enable us to model future interest rate movements, together with our contingent cash flows.

Major European Bank

Your software is very precise and we are very happy.

Equity Derivatives Desk at a Major Investment Bank

We have been using your UNIVOPT for a number of years. We recently hired a new trader and asked him which system he preferred. He said he has worked for 4 investment houses over the last 9 years and he has only ever used UNIVOPT.

Head of Global Derivatives at a Major International Fund Management Company

I am very impressed with the professionalism and sophistication of your Convertible Add-in. We do not have the time to implement all it's features in our own in-house model.

Major Far Eastern Investment Bank

We have looked at your multi-factor convertible model and it looks great. It gives us a competitive edge over the competition who use a single factor convertible model.

Further feedback from some other users

- Recently I downloaded your new version of the add-ins and was astounded by all the possibilities it has.
- There is only one word that I can say: SUPER !!!!!!!!!!!!!!!!!!!!!
- I really appreciate your quick response. I shall get back to you if I have new questions... or need to go to the next level. Thanks very much.
- You have been very helpful - it certainly seems that you clients are right that your speed of response is definitely one of your major strengths.
- We are setting up a swap and FRA trading desk in Mumbai, India and are looking for a pricing and risk analytics engine. I have heard of your formidable reputation in this field and am writing to inquire if you would be able to provide us a suitable solution.
- Thanks a lot for your rapid answer!
- I was very impressed by the products on your site.
- For me you are genius.
- Thank you for your help with this. I made the changes you recommended and everything seems to be working wonderfully now. I especially appreciate how quickly and thoroughly you have responded to my requests for help. I will strongly recommend MBRM to all my option-trading clients.
- Kudos to you and your programming team! Wonderful job on our UMS system & we are all extremely pleased with your product.

PRICE LIST for 32-bit Client Edition Licenses for Windows. (For Server and UNIX Licenses, please contact our Sales Team for a quote)		One Time Fee Per Machine	Quantity Ordered
